

# Consolidated Report

Prithvi Poddar 17191

Note: Report 2 and 3 are the reports on CNN and autoencoder respectively. Those were made on Google Colab as it provides GPU facility. Thus, the .ipynb files regarding the same might not run on the local jupyter notebook. Although I've added those python notebooks in the report directory, I'll leave a link to the Colab notebook here as well . You can visit the link to view the code in Colab.

To run the code, you'll have to make a copy of it in your own drive as my codes are in view only format.

Report 2 (CNN) link:

[https://colab.research.google.com/drive/1GxHUK\\_1YsqA3YGl\\_Ts4SltuB5q7tVE4L?usp=sharing](https://colab.research.google.com/drive/1GxHUK_1YsqA3YGl_Ts4SltuB5q7tVE4L?usp=sharing)

Report 3 (Autoencoder) link:

[https://colab.research.google.com/drive/1\\_qcXU7SAz\\_ZQjyYU9bw3jxThv6E6d3oV?usp=sharing](https://colab.research.google.com/drive/1_qcXU7SAz_ZQjyYU9bw3jxThv6E6d3oV?usp=sharing)

**Starting with Report-1 now.**

## Report-1 (Neural network)

Files: Prithvi\_Poddar\_17191\_Report\_1.ipynb and Prithvi\_Poddar\_17191\_Report\_1.pdf

### Part -1:

I have defined the network as a class in the python file named **network.py** in the parent directory. The code to load the data is in **data\_loader.py** in the parent directory.

In part 1, I start off with using the neural network with normal training and testing data splits and do the hyper parameter tuning for the network. At the end, we find out the the best parameter choices are:

Weight\_initializer = default

Cost = CrossEntropy

Activation = sigmoid

Epochs = 50

Batch\_size = 10

learning\_rate = 0.1

Regularization\_parameter = 7.0

With this we got an accuracy of around 95% on the training data and 88% on the testing data that was provided.

Finally we used **10-fold cross validation** and got training accuracy of 97% and testing accuracy of 96% on the given data.

Then I ran the model on the entire MNIST dataset with cross validation, getting an accuracy of 95% in both training and testing sets.

### Part-2 (PCA data):

Here we ran the same model on the PCA data provided and ended up getting a maximum accuracy of 88% on the test set and 87% on training set. This showed that the PCA data wasn't as good as the original data.

**P.S.** I'd suggest you to look at the python notebook for report 1 as the pdf is too long because the pdf contains the outputs in their entirety. The python notebooks have the outputs too but in smaller windows and hence is easy to follow.

### Report-2 (CNN):

Files: Prithvi\_Poddar\_17191\_report\_2\_CNN.ipynb  
and Prithvi\_Poddar\_17191\_report\_2\_CNN.pdf

Colab link:

[https://colab.research.google.com/drive/1GxHUK\\_lYsqA3YGl\\_Ts4SltuB5q7tVE4L?usp=sharing](https://colab.research.google.com/drive/1GxHUK_lYsqA3YGl_Ts4SltuB5q7tVE4L?usp=sharing)

In this report, for the architecture of the CNN, I took help from

<https://www.kaggle.com/cdeotte/how-to-choose-cnn-architecture-mnist>

as this site has already done some of the experiments to find the optimal parameters. I avoided doing these experiments manually as the CNN in itself takes lot of time to train and hence it would be a highly time taking process to train the model for each parameter.

The architecture of the model is:

```
Network_CNN(  
    (conv1): Conv2d(1, 32, kernel_size=(5, 5), stride=(1, 1))  
    (conv2): Conv2d(32, 64, kernel_size=(5, 5), stride=(1, 1))  
    (fc1): Linear(in_features=1024, out_features=500, bias=True)  
    (dropout1): Dropout(p=0.4, inplace=False)  
    (fc2): Linear(in_features=500, out_features=10, bias=True)  
)
```

At the end of the report, I have also derived the outputs of individual convolutional filters of the CNN to look at what kind of information does the CNN learn.

## Report-3 (CNN):

Files:

Prithvi\_Poddar\_17191\_Report\_3\_Autoencoders.ipynb and

Prithvi\_Poddar\_17191\_Report\_3\_Autoencoders.pdf

Colab link:

[https://colab.research.google.com/drive/1\\_qcXU7SAz\\_ZQjyYU9bw3jxThv6E6d3oV?usp=sharing](https://colab.research.google.com/drive/1_qcXU7SAz_ZQjyYU9bw3jxThv6E6d3oV?usp=sharing)

In this, I built a sparse autoencoder inspired by the notes of Andrew NG on sparse autoencoder.

The model has the following parameters:

```
SparseAutoencoder(  
  (en1): Linear(in_features=784, out_features=256, bias=True)  
  (en2): Linear(in_features=256, out_features=128, bias=True)  
  (en3): Linear(in_features=128, out_features=64, bias=True)  
  (en4): Linear(in_features=64, out_features=32, bias=True)  
  (en5): Linear(in_features=32, out_features=16, bias=True)  
  (de1): Linear(in_features=16, out_features=32, bias=True)  
  (de2): Linear(in_features=32, out_features=64, bias=True)  
  (de3): Linear(in_features=64, out_features=128, bias=True)  
  (de4): Linear(in_features=128, out_features=256, bias=True)  
  (de5): Linear(in_features=256, out_features=784, bias=True)  
)
```

At the end, I've regenerated 20 input images from the validation set, using the autoencoder.

# Prithvi\_Poddar\_17191\_Report\_1

June 22, 2020

## 1 Assignment 4

## 2 Prithvi Poddar 17191

### 2.1 Report: Neural Network

In this report, I'll be running a neural network based completely on numpy and inspired from <http://neuralnetworksanddeeplearning.com/index.html>

The codes can be found in the same directory as this python notebook is.

**P.S. Initially I'll be doing all the parameter tuning using train and test set splitting as this model converges quicker than Cross Validation. This will allow us to get better results in less number of epochs. Once we've decided our parameters, we'll finally use Cross validation to see if it gives better accuracy**

### 2.2 Part 1

#### 2.2.1 Importing the neural network module and the data loader

```
[1]: import matplotlib.pyplot as plt
import numpy as np
import network
import data_loader
%matplotlib inline
plt.rcParams['figure.figsize']=(20,10)
```

#### 2.2.2 Before starting, lets take a look at tunable parameters of this linear network model

weight\_initializer = 'default' or 'large'

cost = 'CrossEntropy' or 'Quadratic'

activation = 'sigmoid' or 'tanh' or 'relu'

size = [n1, n2, ...] {where n1=no. of neurons in first layer, n2=no. of neurons in second layer, and so on}

### 2.2.3 Parameters for training

training\_data, epochs, batch\_size, eta(learning rate), lambda(regularization factor), test\_data

### 2.2.4 Loading the training and testing data

We have total 3000 data entries. We'll be dividing it in 2500 for training and 500 for testing

```
[2]: training_data, testing_data = data_loader.load_full_data()
```

### 2.2.5 Now we call the neural network from the network.py file and start tuning our parameters

### 2.2.6 First, no hidden layer

Here we'll determine which cost function, activation function and weight initializer to use:

1. Choosing the weight initializer

'default' sets the weights randomly from gaussian distribution with mean 0 and standard deviation  $1/\sqrt{\text{number of training data}}$

'large' sets the weights randomly from gaussian distribution with mean 0 and standard deviation 1

```
[3]: net = network.Linear_Network([784,10], weight_initializer='default')
```

```
[4]: net.SGD(training_data, 30, 10, 0.5, lambda = 5.0, test_data=testing_data)
```

Test accuracy: 83.2%

'large' weight initializer performs similar to the 'default' initializer with max test accuracy of 84% and training accuracy of 93%

**Hence we stick to 'default' weight initializer**

## 2. Choosing cost function

First we try out the 'Quadratic' cost

```
[7]: net = network.Linear_Network([784,10], weight_initializer='default',  
    ↪cost='Quadratic')
```

```
[8]: net.SGD(training_data, 30, 10, 0.5, lmbda = 5.0, test_data=testing_data)
```

We see that 'CrossEntropy' gives a slightly better performance of 93% training and 85% testing accuracy.

But we notice from the loss graph that the drop in loss for Quadratic is much smoother than for CrossEntropy.

For now we'll stick to CrossEntropy and hope that the loss graph for the CrossEntropy function will smoothen out as we do further parameter tuning. If not then we'll visit this again and do another comparison between these two after the parameters have been set.

### 3. Choosing activation function

First we try 'sigmoid'

```
[11]: net = network.Linear_Network([784,10], weight_initializer='default',  
    ↪cost='Quadratic',  
        activation = 'sigmoid')
```

```
[12]: net.SGD(training_data, 30, 10, 0.5, lambda = 5.0, test_data=testing_data)
```

Hence we can clearly see that ‘sigmoid’ is the best option we have

Since our initial parameters are set, we can move on to the number of layers and the stochastic gradient parameter tuning. I have already set the above parameters as default for our network so that we don’t have to call them again and again

## 2.2.7 Now we decide the number of neurons and the number of hidden layers

1. 1 hidden layer. Testing for 15 to 50 neurons:

```
[22]: n = [15,20,25,30,35,40,45,50]
train_accuracies=[]
test_accuracies=[]
for neurons in n:
    net = network.Linear_Network([784, neurons, 10])
    tr_a, te_a = net.SGD(training_data, 30, 10, 0.5, lambda = 5.0,
    ↪test_data=testing_data,
        show_eval=False, show_graph=False, return_accuracies=True)
    train_accuracies.append(tr_a)
    test_accuracies.append(te_a)
    print(str(neurons)+" neurons:")
    print("Training acc.: "+str(tr_a)+"% Testing acc.: "+str(te_a)+"%")
    print()
```

```
plt.subplot(2, 1, 1)
plt.plot(n, train_accuracies, label='training accuracy')
plt.plot(n, test_accuracies, label='test accuracy')
plt.legend()
plt.title("Training and testing accuracies")
plt.xlabel("neurons")
plt.ylabel("accuracy %")
plt.ylim(0, 100)
plt.show()
```

15 neurons:

Training acc.: 94.096% Testing acc.: 85.83999999999999%

20 neurons:

Training acc.: 94.576% Testing acc.: 86.32%

25 neurons:

Training acc.: 95.47200000000001% Testing acc.: 87.16%

30 neurons:

Training acc.: 95.26400000000001% Testing acc.: 86.32%

35 neurons:

Training acc.: 95.58399999999999% Testing acc.: 87.16%

40 neurons:

Training acc.: 95.44800000000001% Testing acc.: 86.68%

45 neurons:

Training acc.: 95.55199999999999% Testing acc.: 86.56%

50 neurons:

Training acc.: 95.27199999999999% Testing acc.: 86.47999999999999%

The result is pretty uniform. So lets stick to 35 neurons in the first layer.

Now we test the second hidden layer

```
[23]: n = [15,20,25,30]
train_accuracies=[]
test_accuracies=[]
for neurons in n:
    net = network.Linear_Network([784, 35, neurons, 10])
    tr_a, te_a = net.SGD(training_data, 30, 10, 0.5, lambda = 5.0,
    ↪test_data=testing_data,
        show_eval=False, show_graph=False, return_accuracies=True)
    train_accuracies.append(tr_a)
    test_accuracies.append(te_a)
    print(str(neurons)+" neurons:")
    print("Training acc.: "+str(tr_a)+"% Testing acc.: "+str(te_a)+"%")
    print()

plt.subplot(2, 1, 1)
plt.plot(n, train_accuracies, label='training accuracy')
plt.plot(n, test_accuracies, label='test accuracy')
plt.legend()
plt.title("Training and testing accuracies")
plt.xlabel("neurons")
plt.ylabel("accuracy %")
plt.ylim(0, 100)
plt.show()
```

15 neurons:

Training acc.: 95.84% Testing acc.: 87.44000000000001%

20 neurons:

Training acc.: 95.6% Testing acc.: 87.36000000000001%

25 neurons:

Training acc.: 95.208% Testing acc.: 87.52000000000001%

30 neurons:

Training acc.: 95.96000000000001% Testing acc.: 87.24000000000001%

Here we stick to 25 neurons in 2nd layer

### Testing for 3rd hidden layer

```
[26]: n = [15,20]
train_accuracies=[]
test_accuracies=[]
for neurons in n:
    net = network.Linear_Network([784, 35, 25, neurons, 10])
    tr_a, te_a = net.SGD(training_data, 30, 10, 0.5, lambda = 5.0,
    ↪test_data=testing_data,
        show_eval=False, show_graph=False, return_accuracies=True)
    train_accuracies.append(tr_a)
    test_accuracies.append(te_a)
    print(str(neurons)+" neurons:")
    print("Training acc.: "+str(tr_a)+"% Testing acc.: "+str(te_a)+"%")
    print()

plt.subplot(2, 1, 1)
plt.plot(n, train_accuracies, label='training accuracy')
plt.plot(n, test_accuracies, label='test accuracy')
plt.legend()
plt.title("Training and testing accuracies")
plt.xlabel("neurons")
plt.ylabel("accuracy %")
plt.ylim(0, 100)
plt.show()
```

15 neurons:

Training acc.: 92.744% Testing acc.: 85.28%

20 neurons:

Training acc.: 92.92% Testing acc.: 85.8%

With a decrease in accuracies, we finally stick to 2 hidden layers.

First hidden layer has 35 neurons and second hidden layer has 25 neurons

**Checking the learning rate now. We increase the number of epochs and reduce the learning rate to see where the accuracies saturate** Initially we try 50 epochs with  $\eta=0.1$

```
[27]: net = network.Linear_Network([784, 35, 25, 10])
      net.SGD(training_data, 50, 10, 0.1, lambda = 5.0, test_data=testing_data)
```

Since we tend to get similar results for both  $\eta=0.1$  and  $\eta=0.01$ , we continue with  $\eta=0.1$

**Finally we check if regularization is helpful or not** First with no regularization

```
[30]: net = network.Linear_Network([784, 35, 25, 10])
      net.SGD(training_data, 50, 10, 0.1, lambda = 0.0, test_data=testing_data)
```

Clearly there has been over fitting as the training accuracy is 99%. It doesn't show up on the test accuracy as the testing set is too small. Hence we try different regularization factors to see which fits best

```
[34]: regs = [1.0, 2.0, 3.0, 4.0, 5.0, 6.0, 7.0, 8.0, 9.0]
train_accuracies=[]
test_accuracies=[]
for reg in regs:
    net = network.Linear_Network([784, 35, 25, 10])
    tr_a, te_a = net.SGD(training_data, 50, 10, 0.1, lambda = reg,
    ↪test_data=testing_data,
        show_eval=False, show_graph=False, return_accuracies=True)
    train_accuracies.append(tr_a)
    test_accuracies.append(te_a)
    print("regularization factor:"+str(reg))
    print("Training acc.: "+str(tr_a)+"% Testing acc.: "+str(te_a)+"%")
    print()

plt.subplot(2, 1, 1)
plt.plot(regs, train_accuracies, label='training accuracy')
plt.plot(regs, test_accuracies, label='test accuracy')
plt.legend()
plt.title("Training and testing accuracies")
plt.xlabel("neurons")
plt.ylabel("accuracy %")
```

```
plt.ylim(0, 100)
plt.show()
```

We see the training accuracy constantly dropping while the testing accuracy remained constant. This is indicative of over fitting. But we can't be too sure as the training and testing data is too small. We'd need atleast a bigger testing data to be entirely sure.

So for now, we stick to regularization of 7.0

**We'll revisit the regularization tuning when we look at Cross Validation** Now that we finally have all our parameters, let's take a list them down. Then we'll visualize the results on the testing data

1. size = [784, 35, 25, 10]
2. weight\_initializer = 'default'
3. cost = 'CrossEntropy'
4. activation = 'sigmoid'
5. epochs = 50
6. batch\_size = 10
7. eta = 0.1
8. lambda = 7.0

Final run of the mdoel

```
[3]: net = network.Linear_Network([784,35,25,10])  
net.SGD(training_data, 50, 10, 0.1, lambda = 7.0, test_data = testing_data)
```

Now we are ready to visualize some results: Let's run it on 20 test datas

```
[22]: from PIL import Image
test_set = testing_data[:20]
prediction=[]
label=[]
images=[]
for (x,y) in test_set:
    prediction.append(np.argmax(net.feedforward(x)))
    label.append(y)
    image = x[0]
    image = x.reshape(28,28)*255
    images.append(image)

fig = plt.figure(figsize=(25, 5))

for idx in np.arange(20):
    ax = fig.add_subplot(2, 10, idx+1, xticks=[], yticks=[])
    plt.imshow(images[idx])
    ax.set_title("{} ({}).format(str(prediction[idx]), str(label[idx].item()))),
                color=("green" if prediction[idx]==label[idx] else "red"))
```

### 2.2.8 Now, finally lets use Cross validation to see if we get any improvement

We'll be using k-fold cross validation with k=10

```
[24]: training_data_CV = data_loader.load_full_data_cross_validate()
```

First, without any regularization

```
[28]: net2 = network.Linear_Network_CrossValidation([784,35,25,10])
```

```
[29]: net2.SGD(training_data_CV, 200, 10, 0.5, lmbda=0.0)
```

We see that there has been a little drop in both training and testing accuracy. But we can't be sure it's overfitting as the train and test accuracies are the same.

**2.2.9** So here I take the liberty to test my model using Cross Validation, on the entire MNIST data set.

```
[3]: import mnist_loader
```

```
[5]: training_data_MNIST, validation_data_MNIST, __ = mnist_loader.  
     ↪ load_data_wrapper()
```

```
[6]: net_mnist = network.Linear_Network_CrossValidation([784,35,25,10])
```

```
[7]: """No Regularization"""  
     net_mnist.SGD(training_data_MNIST, 200, 10, 0.5, lambda=0.0)
```

Test accuracy: 94.94%

We can see that the model performs considerably well on the larger dataset of 50000 entries with 95% accuracy. It seems we could get an higher accuracy if we continued for more epochs but considering the enormous time it takes to train the model on the entire data set, we will leave it to this.

Let us now look at the results on the validation data:

```
[10]: print ("Validation accuracy: "+str(net_mnist.  
    ↪ evaluate_validation_accuracy(validation_data_MNIST))+"%")
```

Validation accuracy: 94.87%

Hence we can see that the Cross Validation has clearly improved the performance.

## 2.3 Part 2

Now we test how well does the PCA data work compared to the normal image data. We'll use the same cost and activation here and play with the parameters of the Stochastic Gradient Descent to see which ones fit the best

Starting with no hidden layers:

```
[2]: training_data = data_loader.load_PCA()
```

```
[3]: net = network.Linear_Network_CrossValidation([25,10])
```

```
[4]: net.SGD(training_data, 200, 10, 0.1)
```

We still don't get a result as good as the original images.

This might be because when reducing the dimensionality of the image, we may lose some spatial information of the image. This will make it tough for the neural network to learn some key spatial differences that separates one digit from another.

2.4 With this we end the 1st report. In the next report, we'll train a CNN using PyTorch to train on the entire MNIST dataset

[ ]:

# Prithvi\_Poddar\_17191\_report\_2\_CNN

June 23, 2020

## 1 Report 2

### 1.1 Prithvi Poddar 17191

**1.1.1** In this report, we'll implement a simple Convolutional Neural Network and train it on the entire MNIST dataset so see the results.

P.S. This notebook was created entirely in google colab as it provides GPU facility, so that the training can be faster. Thus, I had to mention all the classes wwithin the notebook itself as I cannot import classes from my local machine. We will be using PyTorch for this notebook

Run the next line if your computer doesn't have pytorch installed. Otherwise you can skip it.

```
[ ]: !pip3 install torch torchvision
```

```
[1]: import torch
import numpy as np
from torch import nn
import torch.nn.functional as F
from torchvision import datasets, transforms
import matplotlib.pyplot as plt
```

```
[2]: device = torch.device("cuda:0" if torch.cuda.is_available() else "cpu")
```

```
[3]: device
```

```
[3]: device(type='cuda', index=0)
```

Creating the transform function to convert the images into tensors that are readable by pytorch

```
[4]: transform = transforms.Compose([transforms.ToTensor(), transforms.Normalize((0.
→5,),(0.5))])
```

Downloading the MNIST dataset from torchvision

```
[5]: training_dataset = datasets.MNIST(root='./data', train=True, download=True,
→transform=transform)
validation_dataset = datasets.MNIST(root='./data', train=False, download=True,
→transform=transform)
```

Downloading <http://yann.lecun.com/exdb/mnist/train-images-idx3-ubyte.gz> to  
./data/MNIST/raw/train-images-idx3-ubyte.gz

```
HBox(children=(FloatProgress(value=1.0, bar_style='info', max=1.0), HTML(value='')))
```

```
Extracting ./data/MNIST/raw/train-images-idx3-ubyte.gz to ./data/MNIST/raw
Downloading http://yann.lecun.com/exdb/mnist/train-labels-idx1-ubyte.gz to
./data/MNIST/raw/train-labels-idx1-ubyte.gz
```

```
HBox(children=(FloatProgress(value=1.0, bar_style='info', max=1.0), HTML(value='')))
```

```
Extracting ./data/MNIST/raw/train-labels-idx1-ubyte.gz to ./data/MNIST/raw
Downloading http://yann.lecun.com/exdb/mnist/t10k-images-idx3-ubyte.gz to
./data/MNIST/raw/t10k-images-idx3-ubyte.gz
```

```
HBox(children=(FloatProgress(value=1.0, bar_style='info', max=1.0), HTML(value='')))
```

```
Extracting ./data/MNIST/raw/t10k-images-idx3-ubyte.gz to ./data/MNIST/raw

```

```
Extracting ./data/MNIST/raw/t10k-labels-idx1-ubyte.gz to ./data/MNIST/raw
Processing...
Done!
```

```
/pytorch/torch/csrc/utils/tensor_numpy.cpp:141: UserWarning: The given NumPy
array is not writeable, and PyTorch does not support non-writeable tensors. This
means you can write to the underlying (supposedly non-writeable) NumPy array
using the tensor. You may want to copy the array to protect its data or make it
writeable before converting it to a tensor. This type of warning will be
suppressed for the rest of this program.
```

```
[6]: training_loader = torch.utils.data.DataLoader(training_dataset, batch_size=100,
    ↪shuffle=True)
validation_loader = torch.utils.data.DataLoader(validation_dataset, batch_size=
    ↪100, shuffle=False)
```

Now we define the training function. We'll be using the Cross Entropy loss and the Adam optimizer.

```
[7]: def train(model, epochs, learning_rate):
    criterion = nn.CrossEntropyLoss()
    optimizer = torch.optim.Adam(model.parameters(), lr=learning_rate)

    training_losses=[]
    training_accuracies=[]
    test_losses=[]
```

```

test_accuracies=[]

for e in range(epochs):
    training_loss = 0.0
    training_accuracy = 0.0
    test_loss = 0.0
    test_accuracy = 0.0

    for inputs, labels in training_loader:
        inputs = inputs.to(device)
        labels = labels.to(device)
        outputs = model.forward(inputs)
        loss = criterion(outputs, labels)
        optimizer.zero_grad()
        loss.backward()
        optimizer.step()

        _, preds = torch.max(outputs, 1) #returns the max value along axis 1
        ↪ along with its index
        training_loss += loss.item()
        training_accuracy += torch.sum(preds==labels.data)

    else:
        with torch.no_grad():
            for val_inputs, val_labels in validation_loader:
                val_inputs = val_inputs.to(device)
                val_labels = val_labels.to(device)
                val_outputs = model.forward(val_inputs)
                val_loss = criterion(val_outputs, val_labels)

                _, val_preds = torch.max(val_outputs, 1)
                test_loss += val_loss.item()
                test_accuracy += torch.sum(val_preds == val_labels.data)

    epoch_loss = training_loss/len(training_loader)
    epoch_acc = training_accuracy.float()/ len(training_loader)
    training_losses.append(epoch_loss)
    training_accuracies.append(epoch_acc)

    val_epoch_loss = test_loss/len(validation_loader)
    val_epoch_acc = test_accuracy.float()/ len(validation_loader)
    test_losses.append(val_epoch_loss)
    test_accuracies.append(val_epoch_acc)
    print('epoch :', (e+1))
    print('training loss: {:.4f}, acc {:.4f}'.format(epoch_loss, epoch_acc.
    ↪ item()))

```

```

        print('validation loss: {:.4f}, validation acc {:.4f} '.
→format(val_epoch_loss, val_epoch_acc.item()))

    return training_losses, training_accuracies, test_losses ,test_accuracies

```

Defining the plotting function to plot the accuracies and losses later on

```

[8]: def plot_loss(training_losses, testing_losses):
    plt.plot(training_losses, label='training loss')
    plt.plot(testing_losses, label='testing loss')
    plt.legend()

[9]: def plot_accuracy(training_accuracies, testing_accuracies):
    plt.plot(training_accuracies, label='training accuracy')
    plt.plot(testing_accuracies, label='testing accuracy')
    plt.legend()

```

**1.1.2 Having defined the helping functions, we can now start forming our CNN module.**

Since, training takes substantial time, even when using a gpu, I'll be referring to the results from <https://www.kaggle.com/cdeotte/how-to-choose-cnn-architecture-mnist>

In the above mentioned link, experiments have already been done to determine the optimum parameters for training on the MNIST data set For our model ,we'll have 2 convolutional layers. The first one with 32 filetrs and second one with 64 filters. Filter size will be 5 with stride=1 There will be 2 fully connected layers with 128 neurons in the first layer and 10 in the second layer which will be the output layer. Activation function will be RELU with softmax applied to the last layer. Intermediate max pooling will be done with kernel size=2 and strides=2. Dropout in the fully connected layer will be 0.4

Important formulae that we'll need are:

**\*\*Output height = ((height-kernel\_size+2\*padding)/stride)+1\*\***

**\*\*Output width = ((width-kernel\_size+2\*padding)/stride)+1\*\***

We'll use max\_pooling of size 2 and stride 2. This will simply half the size of the feature map, hence making our manual calculations easier

```

[10]: class Network_CNN(nn.Module):
    def __init__(self):
        super().__init__()

```

**We get an accuracy of 99%, much more than what we achieved earlier using just fully connected linear neural networks**

```
[13]: plot_loss(training_losses, test_losses)
```

```
[14]: plot_accuracy(training_accuracies, test_accuracies)
```

I had already done some pre-testing with the learning rate and it turned out that a slow learning rate provides a smoother accuracy curve as this network is quite complex in terms of the parameters to be learned

### 1.1.3 Now lets take a look at the individual concolutional layer outputs to try to visualize what the model is learning

```
[15]: data = iter(training_loader)
      images, labels = data.next()

[16]: def im_convert(tensor):
      image = tensor.cpu().clone().detach().numpy()
      image = image.transpose(1, 2, 0)
      image = image * np.array((0.5, 0.5, 0.5)) + np.array((0.5, 0.5, 0.5))
      image = image.clip(0, 1)
      return image

[31]: def filter_convert(tensor):
      image = tensor.cpu().clone().detach().numpy()
      image = image.clip(0, 1)
      return image

[23]: fig = plt.figure(figsize=(2, 2))
      plt.imshow(im_convert(images[3]))
      plt.title(str(labels[3].item()))

[23]: Text(0.5, 1.0, '5')
```

So this will be the input to our network i.e. the image of '5'

```
[19]: a, b, c, d = model.visualize(images.to(device))
```

### 1.1.4 Looking at the output of Conv. Layer 1

```
[32]: fig = plt.figure(figsize=(25, 4))
      for idx in np.arange(20):
          ax = fig.add_subplot(2, 10, idx+1, xticks=[], yticks=[])
          plt.imshow(filter_convert(a[3][idx]))
```

### 1.1.5 Output of the max pool of Conv Layer 1

```
[26]: fig = plt.figure(figsize=(25, 4))
      for idx in np.arange(20):
          ax = fig.add_subplot(2, 10, idx+1, xticks=[], yticks=[])
          plt.imshow(filter_convert(b[3][idx]))
```

### 1.1.6 Output of Conv Layer 2

```
[27]: fig = plt.figure(figsize=(25, 4))
      for idx in np.arange(20):
          ax = fig.add_subplot(2, 10, idx+1, xticks=[], yticks=[])
          plt.imshow(filter_convert(c[3][idx]))
```

### 1.1.7 Output of max pool of Conv Layer 2

```
[28]: fig = plt.figure(figsize=(25, 4))
      for idx in np.arange(20):
          ax = fig.add_subplot(2, 10, idx+1, xticks=[], yticks=[])
          plt.imshow(filter_convert(d[3][idx]))
```

```
plt.imshow(filter_convert(d[3][idx]))
```

## 1.2 Analysis of the above filter images

- 1.2.1 We can see that the 1st Conv Layer grabs the entire image of 5 as a whole along with the major curves and dashes
- 1.2.2 The second Conv Layer grabs the smaller curves and bends that are specific to only the number 5
- 1.2.3 At the end, the number 5 is just a superposition of these curves and dashes and hence the network is able to recognize it!!

# Prithvi\_Poddar\_17191\_Report\_3\_Autoencoders

June 24, 2020

## 1 Report 3: Autoencoders

### 1.1 Prithvi Poddar 17191

In this report, we'll be developing Sparse autoencoder

### 1.2 Sparse Autoencoder

**1.2.1 This autoencoder structure has been inspired by the note of Andrew NG on sparse autoencoders. We'll use the parameters mentioned in the notes itself**

```

Processing...  
Done!

/pytorch/torch/csrc/utils/tensor\_numpy.cpp:141: UserWarning: The given NumPy array is not writeable, and PyTorch does not support non-writeable tensors. This means you can write to the underlying (supposedly non-writeable) NumPy array using the tensor. You may want to copy the array to protect its data or make it writeable before converting it to a tensor. This type of warning will be suppressed for the rest of this program.

```
[40]: training_loader = torch.utils.data.DataLoader(training_dataset, batch_size=32,
    ↪shuffle=True, num_workers=0)
    validation_loader = torch.utils.data.DataLoader(validation_dataset, batch_size=
    ↪32, shuffle=False, num_workers=0)
```

We start off by defining our autoencoder structure. It will have 5 linear encoding layers and 5 linear decoding layers as can be seen below

```
[6]: class SparseAutoencoder(nn.Module):

    def __init__(self):
        super(SparseAutoencoder, self).__init__()

        #encoder
        self.en1 = nn.Linear(784, 256)
        self.en2 = nn.Linear(256, 128)
        self.en3 = nn.Linear(128, 64)
        self.en4 = nn.Linear(64, 32)
        self.en5 = nn.Linear(32, 16)

        #decoder
        self.de1 = nn.Linear(16, 32)
        self.de2 = nn.Linear(32, 64)
        self.de3 = nn.Linear(64, 128)
        self.de4 = nn.Linear(128, 256)
        self.de5 = nn.Linear(256, 784)

    def forward(self, x):
        #encoding
        x = F.relu(self.en1(x))
        x = F.relu(self.en2(x))
        x = F.relu(self.en3(x))
        x = F.relu(self.en4(x))
        x = F.relu(self.en5(x))

        #decoding
        x = F.relu(self.de1(x))
        x = F.relu(self.de2(x))
        x = F.relu(self.de3(x))
        x = F.relu(self.de4(x))
        x = F.relu(self.de5(x))

        return x
```

```
[7]: model = SparseAutoencoder().to(device)
```

Nex we extract the layers in the autoencoder individually so that we can use them to calculate the sparse loss by passing the input images separately through all the layers

```
[8]: model_children = list(model.children())
```

Defining the KL divergence and Sparse Loss

```
[9]: def kl_div(rho, rho_hat):
    rho_hat = torch.mean(torch.sigmoid(rho_hat), 1) #sigmoid to squash the output
    →between 0-1 to get probability distribution
    rho = torch.tensor([rho] * len(rho_hat)).to(device) # converting rho into a
    →tensor of same size as rho_hat, for further calculations
    return torch.sum(rho * torch.log(rho/rho_hat) + (1 - rho) * torch.log((1 -
    →rho)/(1 - rho_hat)))

def sparse_loss(rho, images):
    values = images
    loss = 0
    for i in range(len(model_children)):
        values = model_children[i](values) #computing the activation after passing
        →through the layer i of the model
        loss+=kl_div(rho, values)
    return loss
```

Finally we define the functin to train our model:

```
[10]: def train(model, epochs, learning_rate, RHO, BETA):
    criterion = nn.MSELoss()
    optimizer = torch.optim.Adam(model.parameters(), lr = learning_rate)

    training_losses = []
    test_losses = []

    for e in range(epochs):
        training_loss = 0.0
        test_loss = 0.0
        for inputs, labels in training_loader:
            inputs = inputs.view(inputs.shape[0], -1)
            inputs = inputs.to(device)
            outputs = model.forward(inputs)
            mse_loss = criterion(outputs, inputs)
            sparsity = sparse_loss(RHO, inputs)
            loss = mse_loss + BETA*sparsity
            optimizer.zero_grad()
            loss.backward()
            optimizer.step()

            training_loss+=loss.item()

        else:
            with torch.no_grad():
                for val_inputs, val_labels in validation_loader:
                    val_inputs = val_inputs.to(device)
                    val_inputs = val_inputs.view(val_inputs.shape[0], -1)
                    val_outputs = model.forward(val_inputs)
```

```

        val_mse_loss = criterion(val_outputs, val_inputs)
        val_sparsity = sparse_loss(RHO, val_inputs)
        val_loss = val_mse_loss + BETA*val_sparsity
        test_loss += val_loss.item()

    epoch_loss = training_loss/len(training_loader)
    training_losses.append(epoch_loss)
    val_epoch_loss = test_loss/len(validation_loader)
    test_losses.append(val_epoch_loss)
    print('epoch :', (e+1))
    print('training loss: {:.4f} '.format(epoch_loss))
    print('validation loss: {:.4f} '.format(val_epoch_loss))

    return training_losses, test_losses

```

```
[11]: training_losses, test_losses = train(model, 100, 0.0001, 0.05, 0.001)
```

```

epoch : 1

```

### 1.2.2 Now let's see how well this autoencoder regenerates the images in the MNIST validation dataset

We'll input 20 images from the validation set and see the outputs

```
[14]: def im_convert(tensor):
    image = tensor.cpu().clone().detach().numpy()
    image = image.transpose(1, 2, 0)
    image = image * np.array((0.5, 0.5, 0.5)) + np.array((0.5, 0.5, 0.5))
    image = image.clip(0, 1)
    return image
```

```
[15]: def output_convert(image):
    img = image.view(28, 28)
    img = img.cpu().clone().detach().numpy()
    return img
```

```
[16]: data = iter(validation_loader)
    images, labels = data.next()
```

#### The input images

```
[17]: fig = plt.figure(figsize=(25, 4))

    for idx in np.arange(20):
        ax = fig.add_subplot(2, 10, idx+1, xticks=[], yticks=[])
        plt.imshow(im_convert(images[idx]))
```

```
ax.set_title([labels[idx].item()])
```

```
[18]: imgs = images.to(device)
      imgs = imgs.view(imgs.shape[0], -1)
      reconstructed = model.forward(imgs)
```

### The output images

```
[19]: fig = plt.figure(figsize=(25, 4))

      for idx in np.arange(20):
          ax = fig.add_subplot(2, 10, idx+1, xticks=[], yticks=[])
          plt.imshow(output_convert(reconstructed[idx]))
```

```
